Illustration 1.

Illustration 2.

Part 2: Introduction to the Solar Pathfinder™ by your Teacher

Your teacher will show you the Solar Pathfinder, in its parts and in whole. You will also get casual practice using the Pathfinder. Finally, you will assess the available sunlight at several different locations outside, on slides in a visual presentation, or both. Add to your critical notes as needed, on the photos and illustrations from the previous page and in the space available on this page.

Illustration 3.

Notes:

Part 2:

Introduction to the Solar Pathfinder™ by your Teacher

A blue, circular plastic component, likely a base for a small robot or sensor, is shown from a top-down perspective. It features a central circular opening and three smaller circular holes spaced evenly around its perimeter. The component is resting on a light-colored, textured surface that appears to be a cork mat. A black rectangular label with the word "Base" in white text is positioned in the lower right quadrant of the image.

Base

Instrument Section (1)

A blue leveling bubble level and a compass are shown on a circular, textured base. The bubble level is a blue triangular tool with a central bubble. The compass is a circular instrument with a white face and black markings, showing cardinal and intercardinal directions. The entire setup is on a circular, light-colored, textured surface.

Part 3:
Critical
Definitions

Latitude:

Latitude: The angular distance of a location north or south of the earth's equator. Latitude ranges from 0° at the Equator to 90° at either North or South Pole. Lines of latitude run as circles parallel to the equator. Latitude enables us to specify an exact north or south position on the surface of the Earth (0° - 90° North Latitude or 0° - 90° South Latitude).

Latitude: The angular distance of a location north or south of the earth's equator. Latitude ranges from 0° at the Equator to 90° at either North or South Pole. Lines of latitude run as circles parallel to the equator. Latitude enables us to specify an exact north or south position on the surface of the Earth (0° - 90° North Latitude or 0° - 90° South Latitude).

Longitude:

Latitude: The angular distance of a location north or south of the earth's equator. Latitude ranges from 0° at the Equator to 90° at either North or South Pole. Lines of latitude run as circles parallel to the equator. **Latitude enables us to specify an exact north or south position on the surface of the Earth (0° - 90° North Latitude or 0° - 90° South Latitude).**

Longitude: The angular distance of a location east or west of an established prime meridian (passing through Greenwich, England) that runs from the North Pole to the South Pole. **Longitude enables us to specify an exact east or west position on the surface of the earth (0° - 180° East Longitude or 0° - 180° West Longitude).**

Solar azimuth:

Solar azimuth: Solar azimuth is the compass degree (0° - 360°) that describes the position of the sun along the horizon at any given time.

Solar azimuth: Solar azimuth is the compass degree (0° - 360°) that describes the position of the sun along the horizon at any given time.

Solar altitude or solar elevation:

Solar azimuth: Solar azimuth is the compass degree (0° - 360°) that describes the position of the sun along the horizon at any given time.

Solar altitude or solar elevation: The vertical angle formed between the horizon and the center of the sun's disc at any given time.

Solar noon:

Solar noon: The moment during the day when the sun reaches its highest point in the sky--its maximum elevation or zenith. This is also the moment during the day when the sun is due south--its azimuth is 180° on a compass dial. At this moment, the length of time from sunrise to solar noon is equal to the length of time from solar noon to sunset. Solar noon is usually close to, but is seldom the same as clock noon.

Solar noon: The moment during the day when the sun reaches its highest point in the sky--its maximum elevation or zenith. This is also the moment during the day when the sun is due south--its azimuth is 180° on a compass dial. At this moment, the length of time from sunrise to solar noon is equal to the length of time from solar noon to sunset. Solar noon is usually close to, but is seldom the same as clock noon.

Solar window:

Solar noon: The moment during the day when the sun reaches its highest point in the sky--its maximum elevation or zenith. This is also the moment during the day when the sun is due south--its azimuth is 180° on a compass dial. At this moment, the length of time from sunrise to solar noon is equal to the length of time from solar noon to sunset. Solar noon is usually close to, but is seldom the same as clock noon.

Solar window (definition used most commonly in the solar PV industry): The critical hours of 9am to 3pm that are the most important for the conversion of sunlight into electricity for well-positioned, fixed solar array.

Part 4:
**Applying What
You've Learned**

Part 4: Applying What You've Learned

Answer the questions in the tables that follow according to your teacher's directions. You will need to consult two things to complete them.

- 4-1. Your teacher will provide you with a hard copy of a Sunpath Diagram appropriate for your latitude.
- 4-2. Your teacher will have you view the sun's azimuth, altitude, day length, and solar noon information online for your city, or one close to where you are located.
 - Go to: <https://www.timeanddate.com/sun/>
 - Type your state in the search box
 - Select your city, or the city closest to your location
 - Use the navigation tools to obtain the information needed

**Shade and Sun Evaluation
for a Specific Site**

Third Street

Fourth Street

Grey areas and numbers are shaded.

Second Street

First Street

What are all the numbers on a sunpath diagram...and what do they mean?

What are the all the curves (or arcs)...and what do they mean?

The sum of the numbers across each row is 100. Each number indicates the percent of sunlight available during a minute time segment for an average day of the month indicated.

The image shows a Solar Pathfinder device, a circular dial used for solar site analysis. The dial is labeled "SUN PATHS FOR EACH MONTH" and "39° N. LAT". It features a grid of numbers representing the percentage of sunlight available during a minute time segment for an average day of the month indicated. The months listed are JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC. The times listed are 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12. A yellow band highlights the sun path for April, showing values ranging from 1 to 7. A blue "100" is written on the right side of the dial.

100

The sum of the numbers across each arc is 100.

There are 12 arcs, one for each month.

100 sum of the numbers across each arc
X 12 arcs (one for each month)

= **1200** sum of all of the numbers on a
sunpath diagram

Tenth
Street

Sunpath Diagram for Tenth Street

Percentage of sunlight available number from sunpath diagram		Number of these numbers located in shade from the sunpath diagram			Calculate the percentage of sunlight available for the year at this location in the space below. Show your math work in detail..
1	X	24	=	24	$ \begin{array}{r} 1200 \\ - 58 \\ \hline =1142 \\ \\ (1142 / 1200) \times 100 = \\ 96\% \end{array} $
2	X	13	=	26	
3	X	1	=	3	
4	X	1	=	5	
5	X		=		
6	X		=		
7	X		=		
8	X		=		
9	X		=		
				$ \begin{array}{r} 58 \\ \hline \text{Sum total of sunpath diagram shaded numbers} \end{array} $	$ \begin{array}{r} 96\% \\ \hline \text{Percentage of sunlight available for the year at this location.} \end{array} $

5-1. The people who own the residence where your tracing was made need a loan to cover most of the purchase and installation costs for the solar PV system they want to install. Imagine you are a bank loan officer. Do you believe the percentage of sunlight available for the year at this location is enough for you to approve the loan? Answer yes or no, then provide your reasoning.

*

Part 6:
**Show What
You Know**

Part 6: Show What You Know

6-1. Demonstrate what you've learned in this lesson in answering the following question. How does the Solar Pathfinder enable most people (buyers, installers, bankers) to make good, site-specific decisions about where to locate a solar PV system?

*

Part 6: Show What You Know

6-2. The Solar Pathfinder provides data on the percentage of sunlight available for the year at a given site. Develop a paragraph that describes at least three additional factors that often make a difference in determining whether or not a solar PV system makes sense for most people to install.

*

Part 6: Show What You Know

6-3. Describe the most important idea, concept, principle, or fact you learned while completing this this part of the lesson. Explain why it is important for you (and probably other people) to know and understand.

*
