

Crystallography Overview for MEMS

Assessment

Instructor Guide

This assessment is designed to determine the participant's knowledge of crystallography, silicon crystal structure, and Miller Indices. This assessment could be with the Knowledge Probe to help determine a participants level of learning. This is the assessment is part of the Crystallography Learning Module.

The Crystallography Learning Module consists of the following:

- Knowledge Probe (pre-quiz)
- Crystallography Overview for MEMS PK
- Growing Crystals – Hot Ice Activity
- The Miller Index Activity
- Breaking Wafers - Activity
- An Origami Crystal - Activity
- **Crystallography Assessment**

This companion Instructor Guide (IG) contains both the questions and answers for the assessment questions. The Instructor Guide booklet contains this IG followed by the Participant Guide (PG) assessment which contains only the questions.

Introduction

The purpose of this assessment is to determine your understanding of crystallography, silicon crystal structure, and Miller Indices as it relates to microsystems technology and fabrication.

There are 15 questions

1. Which of the following BEST defines Crystallography? The science of ...
 - a. developing arrangements for atoms in solid matter.
 - b. determining the arrangement of atoms in solid matter.
 - c. studying the properties of atoms in solid crystal.
 - d. developing new crystals using atomic structures.

Answer: b

2. Matter without a regular arrangement of atoms is called...
 - a. Amorphous
 - b. Chaotic
 - c. Polycrystalline
 - d. Crystalline

Answer: a

3. In a crystal, the simplest repeating section of atoms is called the
 - a. Single crystal
 - b. Poly crystal
 - c. Unit cell
 - d. Crystal seed

Answer: c

4. Polycrystalline solids consist of small crystals called _____, that are separated by _____.
 - a. Unit cells, cell boundaries
 - b. Amorphous solids, amorphous boundaries
 - c. Single crystals, crystal boundaries
 - d. Grains, grain boundaries

Answer: d

5. What type of solid is peanut brittle?
 - a. Amorphous
 - b. Chaotic
 - c. Polycrystalline
 - d. Crystalline

Answer: a

6. Which of the following is NOT a characteristic of monocrystalline silicon?
- a. Longer range order compared to polycrystalline silicon
 - b. Well-ordered silicon atoms arranged in a lattice structure
 - c. Many single crystalline solids held together by ionic bonds

Answer: c

7. The material properties of a silicon wafer are determined by surface atoms and the _____ of the silicon wafer.
- a. crystal orientation
 - b. doping concentration
 - c. long range order
 - d. bandgap

Answer: a

8. What is the roadmap or compass called for identifying the crystal planes of single crystals?
- a. X-ray diffraction
 - b. Crystallography
 - c. Miller Index
 - d. Cartography

Answer: c

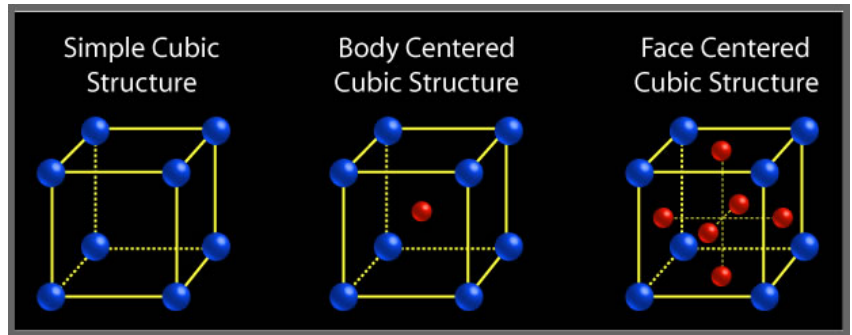

9. Which of the following BEST describes why crystalline silicon is used for microsystems fabrication?
- a. Readily abundant and can be easily formed into polycrystalline ingots and cut into wafers
 - b. Its relatively short range order, strength, and unique ability to be etched along grain boundaries
 - c. Its semiconductor properties that allow it to act as an insulator or a conductor depending on design
 - d. Its unique electrical and mechanical properties that make it possible to form specific well-defined structures

Answer: d

10. There are different configurations for unit cells with each configuration having different number of atoms. A face centered cubic structure has how many atoms?

a. 1
b. 4
c. 7
d. 15

Answer: b

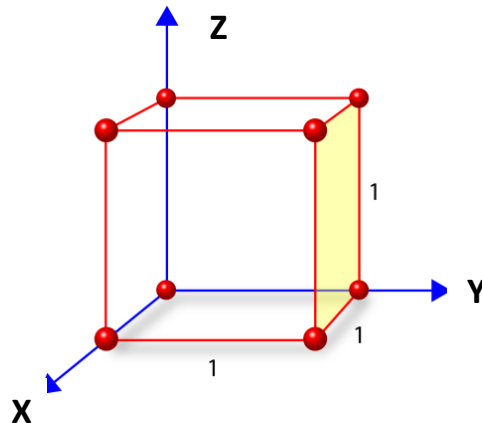

11. A silicon atom has _____ valence electrons that are shared with _____ other silicon atoms when forming a crystal.

a. 8, 8
b. 6, 2
c. 4, 4
d. 2, 6

Answer: c

12. What is the Miller Index notation for the yellow plane in this diagram?

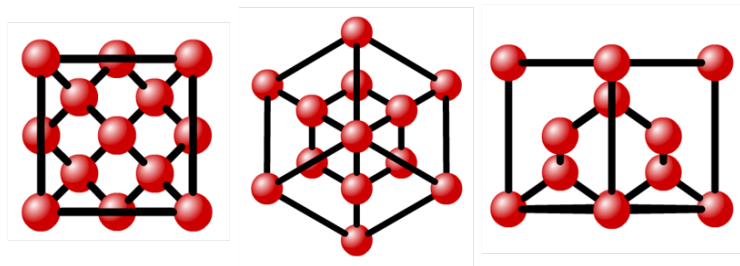

a. (100)
b. (010)
c. (001)
d. (110)
e. (111)

Answer: b

13. The following diagram represents different _____ in the same crystal structure.

a. Grains
b. Unit cells
c. Growth structures
d. Crystal planes

Answer: d

14. In the manufacture of silicon wafers, the crystal orientation of the wafers is determined by the...
- a. purity of the silicon
 - b. orientation of the seed crystal
 - c. type of seed crystal
 - d. pull rate of the ingot

Answer: b

15. The bulk modulus of a microsystems structure is determined by the _____ properties of the material in which they are constructed.
- a. dimensional
 - b. electrical
 - c. mechanical
 - d. optical

Answer: c

Support for this work was provided by the National Science Foundation's Advanced Technological Education (ATE) Program through Grants. For more learning modules related to microtechnology, visit the SCME website (<http://scme-nm.org>).
